

# VEGETATION OF THE GIPPSLAND LAKES CATCHMENT

by

P. K. GULLAN, N. G. WALSH AND S. J. FORBES\*

## ABSTRACT

The catchment of the Gippsland Lakes, Victoria, was surveyed between November 1977 and December 1978, using a floristics-based, quadrat-sampling technique. The data from 722 quadrat sites were analysed via a computer-based, numerical sorting and classification procedure to determine the major, floristic vegetation types of the areas. These types were then arranged, hierarchically, into 13 floristic *communities* each of which contained one or more distinct, floristic *sub-communities*.

The communities defined in this paper range from alpine heathlands and woodlands in the north of the study area, through montane and lowland forests in central districts to coastal heathlands and woodlands in the south-east.

## INTRODUCTION

This paper presents the results of a vegetation survey of the Gippsland Lakes catchment. Its purpose is to define and describe the major floristic types in the vegetation of the study area and to give an indication of the geographic and environmental ranges of each.

---

\*National Herbarium of Victoria, Birdwood Avenue, South Yarra, Victoria 3141.

Fig. 1. Location of the study area. Stippling represents the Lakes Catchment.

### THE STUDY AREA

The Gippsland lakes catchment is the combined catchment area of five major river systems which run into the coastal lakes of East Gippsland, Victoria (Figs. 1 and 2). These river systems are (from west to east) the Latrobe (major tributaries are the Thomson and Macalister Rivers), Avon, Mitchell (major tributaries are the Wonnangatta, Wongungarra and Dargo Rivers) Nicholson and Tambo (major tributary is the Timbarra River) Rivers. The catchment is approximately 22,000 km<sup>2</sup> in area and ranges in altitude from above 1500 m, in the Victorian Alps, to sea level. About 65% of the catchment is covered by native vegetation, most of which is crown land controlled by the Victorian Forests Commission, the Crown Lands Department or the National Parks Authority. The country devoid of native vegetation is predominantly privately owned and utilized for agriculture (mainly grazing) although extensive areas of crown land north and south of Sale support plantations of *Pinus radiata*. The largest area of unvegetated country lies immediately north and west of the lakes and extends to the foothills of the Great Dividing Range below 200 m (Fig. 2). This area is associated with the major townships and extends north and south of the Princes Highway between Warragul and Bairnsdale and east and west of the Omeo Highway between Bairnsdale and Omeo.

### THE SURVEY

#### Method

#### FIELD WORK

The entire study area was divided into rectangles of dimensions 5 minutes latitude and 5 minutes longitude (Fig. 3). Within each rectangle substantially covered by native vegetation four sample sites were chosen (occasionally more in the varied vegetation near the coast and occasionally less in rectangles that were poorly vegetated) so that they differed as much as possible in gross habitat features (ridgetop, river, swamp, hillside etc.). At each site 20 mammal traps were laid (this survey was a combined zoological-botanical project) in an irregular line and floristic information was collected along this line and approximately 5 m to each side. The traplines varied in length but were commonly about 100 m long so that a vegetation sample usually covered an area of approximately 1,000 m<sup>2</sup>. Within this area every vascular plant species was identified and assigned a cover-abundance value (Braun-Blanquet, 1928) corresponding to a visual estimate of its performance in the area.

In all, 722 sites (Fig. 4) were sampled from 179 rectangles between October 1977 and December 1978 (11 field trips each of 12 days duration). Approximately 25 rectangles eligible for sampling were not investigated, primarily because of their inaccessibility at the time of survey.

Fig. 2. The study area. Different density stippling represents different altitude ranges.

Fig. 3. The 5' latitude  $\times$  5' longitude grid system superimposed on a map of the study area.

Fig. 4. Distribution of sample sites within the study area. The blank areas to the south-west and in the north-east are mostly agricultural land and *Pinus radiata* plantations.

## PLANT IDENTIFICATION

All plants which could not be identified in the field were collected, labelled and taken to the National Herbarium for closer examination and comparison with the Herbarium's reference collection. This allowed the identification, to species level, of all but a few plants collected. Nevertheless a number of qualifications must be made concerning the nomenclature used in this paper. As far as possible all nomenclature follows that of Willis (1970, 1973) with amendments by Todd (1979). However, due to the difficulty in distinguishing between certain closely related groups of species, particularly those for which vegetative parts only could be found, some names should be taken to mean one of two or more species. For example:

*Eucalyptus rubida*, *E. dalrympleana*—no distinction has been made between these closely related species. All have been recorded as *E. rubida*.

*Geranium potentilloides*, *G. solanderi*, *G. retrorsum*—distinctions between these species is difficult in the absence of flowering and fruiting material. Wrong names may have been applied in these circumstances.

*Hydrocotyle hirta*, *H. laxiflora*, *H. algida*—as above.

*Gnaphalium spicatum*, *Gamochaeta purpurea*—as above

*Poa australis* spp. agg.—no attempt was made to distinguish between the 17 species of this group described by Vickery (1970).

*Rubus fruticosus* spp. agg.—no attempt was made to distinguish between the 8 species of this group described by Amor and Miles (1974).

*Luzula campestris* spp. agg.—no attempt was made to distinguish between the species of this group described by Nördenskiöld (1969) and Edgar (1975).

*Plantago varia*—no attempt was made to distinguish between members of this group assigned to other species by Briggs, Carolin and Pulley (1973).

*Juncus* spp. (section Genuini)—species within this group may have been misidentified. The taxonomy of this section is in considerable confusion and current revisionary work is still incomplete.

## DATA STORAGE AND ANALYSIS

Floristic information from each site has been permanently stored on magnetic disk along with its locality (latitude-longitude), altitude (metres above sea level) and date of collection. Analyses were in the form of a computer-based, numerical classification procedure, coupled with a hand-sorting procedure of the type outlined in Gullan (1978). The final result of this type of analysis is a two-way table which contains all of the raw data in a sorted form. However, the two-way tables presented in this paper contain only a portion of the total number of species found in the survey. This is because most species occur in 10% or less of the sites and add little to the overall vegetation description.

The tables themselves are laid out in the following way. Numbers opposite 'QUADRATS' are labels for site localities. Each vertical column of figures represents a list of the species found in one site and each horizontal row represents all the sites in which one species has been found. The plus signs and numbers within the body of the tables indicate the cover abundance for each species at each site (See caption to Table 1).

The sample sites are not listed in numerical order, nor are the species names in alphabetical order, and this is so because the table has been sorted (by the above procedure) in two ways:

1. All sample sites which share a large number of species have been placed close together.
2. All species which are often found together in the field are placed together on the table.

Groups of sample sites have been defined and are delineated by vertical lines on the tables. These site-groups represent the vegetation communities and their sub-communities. Each of these will be examined in detail later in this paper. Horizontal lines on the table delineate groups of species which characterise each sub-community or community.

### Terminology

The terms sub-community, community and character species have specific definitions in the context of this paper. The first two of these have been chosen to label vegetation types because they have not often been used in vegetation work before and consequently do not carry with them the confusion and controversy associated with terms such as formation, association and alliance.

#### SUB-COMMUNITY

A sub-community is a group of quadrats which have a similar floristic composition. It is synonymous with the term 'nodum' of Poore (1955) and is the basic unit of vegetation used in this paper.

#### COMMUNITY

A community is a collection of sub-communities (or sometimes a single sub-community) which have floristic and environmental affinities. The community may represent a floristic continuum along which arbitrary divisions have been made to form sub-communities. It may also represent a collection of sub-communities which are considered to be different temporal phases of the same vegetation. Or it may represent a collection of sub-communities which are considered to be a single vegetation type under different disturbance regimes.

#### CHARACTER SPECIES

A character species is one which occurs frequently and consistently within a sub-community and is consequently useful as part of the sub-community description. It is not necessarily confined to the particular sub-community. In this study, the minimum frequency of occurrence necessary for any species to be accepted as a character species has been determined in the following way:

Where  $F$  = minimum allowable frequency of a character species, and  
 $Q$  = number of quadrats in the sub-community or community  
 Then if  $Q < \text{or} = 10$ ,  $F = 55$   
 if  $Q > \text{or} = 50$ ,  $F = 35$   
 if  $Q > 10 \text{ or} < 50$ ,  $F = 55 - (Q - 10)/2$

Thus, if a community or sub-community contains 50 quadrats or more, a character species must occur in at least 35% of these. If a community or sub-community contains 10 quadrats or less then a character species must occur in at least 55% of these. Minimum frequency values for communities or sub-communities containing between 10 and 50 quadrats are calculated (by the above method) as lying somewhere between 55% and 35%.

The choice of the two frequency limits was arbitrary although based on the logic that as the number of sites representing a community or sub-community increases the necessary frequency of occurrence for useful indicator species decreases.

#### COMMUNITY NAMES

Community names have been designed in this paper to take the form of "common names". These common names do not follow any set rules such as those of Specht (1970) or Braun-Blanquet (1928) because they are not intended to form the basis for a formal nomenclature. Their purpose is identical to that of common names used for animals and plants. That is, to provide a familiar and descriptive name which takes into account common, although often imprecise, terminology.

Each name usually comprises a structural part (heath, woodland, forest etc.), an environmental part (dry, wet, riparian, alpine, coastal etc.) and a floristic or life-form part (sclerophyllous, *Banksia*, Snow Gum etc.). However, some, such as Dry Sclerophyll and Wet Sclerophyll Forest, are "old-fashioned" names which have already become well-used common names, and others, such as Damp Sclerophyll Forest, are invented names which are designed to relate to the established terms.

The naming system devised here is not necessarily recommended as a standard to be followed by others. However, it is the experience of the authors that names of this type are those most frequently used in verbal discussions and descriptions of vegetation. They are offered here as a further means of conveying to the reader something about the vegetation being described.

### Limitations and qualifications

#### PLANT IDENTIFICATION

Each quadrat site was visited once only with the consequence that most plant species had to be identified without flowering or fruiting material. This problem was particularly acute during autumn and winter.

With experienced field botanists many species can be identified with confidence from vegetative material. However, there are always problems with monocotyledons and herbaceous dicotyledons (see previous remarks on Plant Identification). A more significant and basically insoluble problem is the absence of any visible signs of many annual species at certain times of the year (particularly autumn and winter). A few of these have been identified from dried remains present at the time of survey but many orchids, *Wahlenbergia* spp., lilies, sundews etc. will have been missed if the survey time did not coincide with the flowering period of the plant.

#### DISTRIBUTION OF FLORISTIC VEGETATION TYPES

The average distance between quadrats was between 4 and 5 kilometres. It is considered that this sampling intensity was great enough to determine all the major floristic vegetation types of the area and to give a good representation of their geographical ranges. However, the distribution maps provided in the RESULTS of this paper should not be interpreted as vegetation maps. They simply represent the distribution of each community or sub-community over all the sites sampled. If two adjacent quadrats share the same vegetation sub-community it *should not* be assumed that all the land between those sites also supports that sub-community.

#### WEED PROBLEM

An index of introduced (since European settlement) plant species has been calculated for each quadrat site to give some indication of weed invasion into the native plant communities (see the sub-community summary sheets). It should not be assumed that this information is in any way indicative of weed problems or weed distribution in the study area as a whole. The purpose of this study is to examine the native plant areas and sites badly infested with weeds were purposely avoided. Therefore, while the list of native plants in this paper might be considered as a good representation of the native flora of the study area the list of weed species will be a gross underestimate. Similarly, many of the weeds that have been recorded in quadrats will be far more widely spread than this paper indicates.

## RESULTS

For easy access of any piece of information relevant to the aims of this paper, the results of the survey and its analyses have been prepared in a number of ways.

### Two-way Tables

The first of the data presentations is a series of two-way tables (Tables 1-7). These are the most important information sources for describing floristic variation

across the study area. They contain almost all of the raw data (only those species with occurrences in less than about 5% of the quadrat sites are absent) arranged in such a way as to represent:

- a. The quadrats which make up each community and sub-community.
- b. The species which characterise them.
- c. The relationships and differences between communities and sub-communities.
- d. The variation within communities and sub-communities.
- e. The distribution of species not often characteristic of communities or sub-communities but which occur sporadically throughout the study area.
- f. The cover-abundance of each species in each quadrat.

In short, the two-way tables contain the most complete and succinct description of the floristic composition of the vegetation.

It is worth noting that the two-way tables presented in this paper contain information from a much larger area and from sites much further apart than in most previous studies which use two-way tables (e.g. Bridgewater 1975, Gullan et al. 1976, Gullan 1978). As a consequence the tables are more heterogeneous than many others in the literature.

### Community Descriptions

Thirteen communities have been described and named in the Gippsland Lakes catchment (GLC). These are representative of the major, extant vegetation types of the area. Other communities, now heavily disturbed or virtually absent, were obviously more important and widespread in the past. However, data from the present survey do not describe them adequately (due to the relatively low-intensity sampling) and no descriptions of them appear in this paper.

Of the 722 quadrats from this survey 48 have not been dealt with in this paper because they did not fit in to the vegetation classification. These quadrats contain vegetation which is grossly disturbed, representative of communities which are no longer widespread (e.g. Open-Forests containing *Eucalyptus tereticornis*) or fragments of vegetation types better developed elsewhere (e.g. western remnants of East Gippsland rainforests).

The following is a brief description of each of the major communities:

GLC COMMUNITY 1: ALPINE WET HEATHLANDS (2 sub-communities; 32 sites).

Closed heath to low woodlands of plains and damp depressions in the high country from the Nunniong Plateau to the Snowy Range.

GLC COMMUNITY 2: SNOW GUM WOODLANDS (2 sub-communities; 33 sites).

Low woodland of the well-drained ridges of the high country from the Nunniong Plateau to the Snowy Range but concentrated in the Mt. Hotham Area.

GLC COMMUNITY 3: MONTANE FOREST (3 sub-communities; 117 sites).

High altitude open and tall open-forest. The predominant vegetation of the high country from the Nunniong Plateau through to the Baw Baw Plateau. It is found primarily on the more sheltered hillsides away from exposed ridges.

GLC COMMUNITY 4: MONTANE RIPARIAN FOREST (2 sub-communities; 41 sites).

High-altitude, riparian, tall open-forest occurring in the upper reaches of rivers from the Tambo to the Macalister. It is closely associated, both floristically and geographically, with the Wet Sclerophyll Forest of community 5.

GLC COMMUNITY 5: WET SCLEROPHYLL FOREST (1 sub-community; 73 sites).

Tall open-forest usually dominated by *Eucalyptus regnans*, but otherwise dominated by a mixture of *E. obliqua*, *E. cypellocarpa*, *E. viminalis*, *E. radiata* or *E. dives*. This forest occupies two distinct parts of the study area. The

largest and best developed forests (mostly *E. regnans* forests) are west and south of the Snowy Range. The other area (where *E. regnans* is uncommon), south of Omeo, is less extensive and confined to the upper reaches of the Nicholson and Tambo Rivers.

GLC COMMUNITY 6: DAMP SCLEROPHYLL FOREST (6 sub-communities; 118 sites).

Open-forest community distributed throughout the intermediate altitudes of the study area in a broad band from Powelltown to Buchan. This community is floristically quite variable both compositionally and diversally. This is indicative of its wide geographical range and heavy forestry usage, accompanied by intense and varied fuel reduction procedures.

GLC COMMUNITY 7: MONTANE, SCLEROPHYLLOUS WOODLAND (1 sub-community; 28 sites).

A woodland community distributed on exposed ridges to the north-east and south-west of the Snowy Range. The understory is dominated by sclerophyllous, small-leaved, heathland-type plants.

GLC COMMUNITY 8: DRY SCLEROPHYLL FOREST (2 sub-communities; 76 sites).

Open-forest scattered on dry foothills surrounding tributaries of the Tambo, Nicholson, Mitchell, Avon, Macalister and Latrobe Rivers.

GLC COMMUNITY 9: RIPARIAN FOREST (4 sub-communities; 57 sites).

A floristically rich, riparian, open-forest scattered through dry foothill country surrounding tributaries of the Avon, Mitchell, Nicholson and Tambo Rivers.

GLC COMMUNITY 10: *Leptospermum myrsinoides* HEATHLAND (1 sub-community; 25 sites).

Low open-woodland and closed heath inland from the Gippsland lakes and the Coastal Banksia Woodlands. This community is distributed mainly south and west from Sperm Whale Head on podzols developed from siliceous sands.

GLC COMMUNITY 11: LOWLAND, SCLEROPHYLLOUS FOREST (2 sub-communities; 28 sites).

Open forest distributed in the lowlands north of Lakes Entrance.

GLC COMMUNITY 12: COASTAL BANKSIA WOODLAND (1 sub-community; 43 sites).

Low open-woodland distributed along the leeward side of the Ninety Mile Beach, all around the Gippsland Lakes, immediately adjacent to the water. The soil supporting this community is made up largely of calcareous sands.

GLC COMMUNITY 13: PRIMARY DUNE SCRUB (1 sub-community; 3 sites).

Primary dune community of low shrubs, forbs and grasses extending from Seaspray to Lakes Entrance.

### Sub-community Summary Sheets

The following three sets of information have been incorporated into a single-page layout for each sub-community. This combination of information constitutes the primary means of describing vegetation in this paper.

**SUB-COMMUNITY DISTRIBUTION MAPS:** For each sub-community, the distribution of all its constituent sites (large black dots) has been superimposed on a map containing the Lakes, major river systems and basic topographic information.

**SUB-COMMUNITY TABLES:** In these tables information from the two-way tables has been summarised and presented in a simplified format. The names of the species which are characteristic of a sub-community are listed along with their frequency of occurrence and the average cover-abundance (C/A) of each species when it occurs. The order of the species in these tables is in accordance with their frequency in the sub-community. This order is at variance with the two-way tables which arrange

species so that sub-community and community interrelationships are best demonstrated. Consequently, although it is easier to assess individual sub-communities from the sub-community tables it is less easy to compare one sub-community with another.

**SUB-COMMUNITY DESCRIPTIONS AND ANNOTATIONS:** A simple verbal description has been made for each of the sub-communities which includes briefly summarised information on their distribution, environment and conservation significance. Included with these descriptions are details of altitude, vegetation structure, floristic richness and weed composition.

#### ACKNOWLEDGEMENTS

This project was carried out in conjunction with the survey team of the Fisheries and Wildlife Division. The authors are indebted to all members of that team for assistance in almost every aspect of the fieldwork.

Able field and laboratory assistance from within the National Herbarium was provided by Liz Muffatti, Suzanne Goodchild and, in particular, Vivienne Turner.

David Parkes spent many hours producing the finally sorted two-way tables for this paper. Ray Smith was frequently helpful with the identification of difficult specimens. Dr David Churchill and Dr Jim Ross were both encouraging professionally and helpful administratively throughout the course of this project. Diane Jenkins patiently typed and retyped all the pages of this paper.

Two of us (N.G.W. and S.J.F.) received financial support from the Ministry for Conservation during the latter part of this work.

## ALPINE WET HEATHLANDS GLC COMMUNITY 1 : SUB-COMMUNITY 1

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 8 (1.1% of total)
<i>Baeckea gunniana</i>	100	2	DISTRIBUTION : Restricted to the higher plateaux of the study area - Nunlong Plateau north of Ensay and Snowy Range north of Licola.  ENVIRONMENT : Exposed, damp depressions within high altitude plains.  ALTITUDE : Mean = 1332m, Highest = 1500m, Lowest = 1040m  STRUCTURE : Closed heath  MEAN FLORISTIC RICHNESS : 32 species per site  MEAN WEED COMPOSITION : 2% of species, 1% of cover  NOTES : This sub-community is an alpine heath, containing several species which are characteristic of no other sub-community. This is the only sub-community in the alpine/subalpine range which is effectively devoid of a eucalypt canopy. Alpine heathlands are quite widespread in Victoria but the area they occupy is very small. Consequently the eight sites represented in this study although indicative of the area covered by this sub-community, are inadequate as descriptors of the variation in these complex communities.
<i>Empodisma minus</i>	100	3	
<i>Epacris paludosa</i>	100	2	
<i>Epacris breviflora</i>	75	1	
<i>Hakea microcarpa</i>	75	1	
<i>Poa australis</i> spp. agg.	63	1	
<i>Asperula gunnii</i>	63	1	
<i>Callistemon sieberi</i>	63	2	
<i>Comesperma retusum</i>	63	+	
<i>Epacris microphylla</i>	63	1	
<i>Gonocarpus micranthus</i>	63	1	
<i>Sphagnum</i> spp.	63	2	

## ALPINE WET HEATHLANDS GLC COMMUNITY 1 : SUB-COMMUNITY 2

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 23 (3.3% of total)
<i>Poa australis</i> spp. agg.	100	1	DISTRIBUTION : Confined largely to the Snowy Range region but also occurring north of Mt. Baw Baw, near Matlock and near Mt. Tabletop & Phipps south of the Omeo to Hotham Heights road.
<i>Acaena anserinifolia</i>	91	1	
<i>Eucalyptus pauciflora</i>	83	1	ENVIRONMENT : High altitude plains either fringing areas like sub-community 1.1 or in slightly more sheltered situations.
* <i>Hypochoeris radicata</i>	83	+	
<i>Cotula filicula</i>	83	+	ALTITUDE : Mean = 1336m, Highest = 1630m, Lowest = 1020m
<i>Celmisia longifolia</i>	78	+	
<i>Epacris paludosa</i>	74	2	STRUCTURE : Low open-woodland to closed heath.
<i>Baeckea gunniana</i>	74	2	
<i>Stellaria pungens</i>	74	1	MEAN FLORISTIC RICHNESS : 52 species per site
<i>Empodisma minus</i>	74	1	
<i>Gonocarpus tetragynus</i>	74	+	MEAN WEED COMPOSITION : 5% of species, 4% of cover
<i>Stylidium graminifolium</i>	74	1	
<i>Grevillea australis</i>	70	1	NOTES : Although this sub-community is an alpine woodland, the shrubs and herbs it shares with sub-community 1.1 reflect its affinities with a damp alpine heath.
<i>Callistemon sieberi</i>	70	1	
<i>Leucopogon suaveolens</i>	65	1	
<i>Luzula campestris</i> spp. agg.	65	+	
* <i>Trifolium repens</i>	61	1	
<i>Carex appressa</i>	61	2	
<i>Helichrysum scorpioides</i>	61	1	
<i>Asperula gunnii</i>	61	1	
<i>Tasmania xerophila</i>	61	1	
<i>Oxylobium alpestre</i>	61	1	
<i>Deyeuxia quadriseta</i>	61	+	
<i>Viola hederacea</i>	61	+	
<i>Blechnum pennamarina</i>	57	1	
<i>Oreomyrhis eriopoda</i>	57	1	
<i>Viola betonicifolia</i>	57	+	
<i>Bossiaea foliosa</i>	57	1	
<i>Hydrocotyle hirta</i>	52	1	
<i>Carex breviculmis</i>	52	+	
<i>Leptorhynchus squamatus</i>	52	+	
* <i>Acetosella vulgaris</i>	52	1	

## SNOW GUM WOODLANDS GLC COMMUNITY 2 : SUB-COMMUNITY 1

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 25 (3.5% of total)
<i>Poa australis</i> spp. agg.	96	2	DISTRIBUTION : Occurs on higher ridges of the Great Dividing Range in the Mt. Hotham region, along the northern extremities of the Snowy Range, and with isolated occurrences on the Dargo High Plains and near Mt. Sindi, north of Ensay.  ENVIRONMENT : Ridgetops and nearby slopes, frequently with exposed basalt outcrops. Drier slopes than those supporting community 1.  ALTITUDE : Mean = 1476m, Highest = 1703m, Lowest = 1300m  STRUCTURE : Low woodland  MEAN FLORISTIC RICHNESS : 42 species per site  MEAN WEED COMPOSITION : 9% of species, 8% of cover  NOTES : This sub-community embraces what is commonly known as Snow Gum Woodland. It contains a wide variety of low perennial herbs and grasses forming a dense ground layer. The shrub layer is usually less than 1.5m and comparatively sparse.
<i>Stellaria pungens</i>	96	1	
<i>Eucalyptus pauciflora</i>	92	2	
<i>Viola betonicifolia</i>	88	1	
<i>Oreomyrrhis eriopoda</i>	84	1	
<i>Oxylobium alpestre</i>	80	2	
* <i>Acetosella vulgaris</i>	80	1	
* <i>Hypochoeris radicata</i>	80	1	
<i>Acaena anserinifolia</i>	80	1	
<i>Geranium potentilloides</i>	80	1	
<i>Leucopogon suaveolens</i>	80	1	
<i>Cotula filicula</i>	76	+	
<i>Tasmania xerophila</i>	72	1	
<i>Luzula campestris</i> spp. agg.	72	+	
<i>Polystichum proliferum</i>	72	1	
<i>Epilobium cinereum</i>	68	1	
<i>Arthropodium milleflorum</i>	60	+	
<i>Scleranthus biflorus</i>	60	+	
<i>Senecio lautus</i>	60	1	
<i>Celmisia longifolia</i>	56	1	
* <i>Cerastium glomeratum</i>	56	+	
* <i>Trifolium repens</i>	56	1	
<i>Olearia phlogopappa</i>	52	1	
<i>Craspedia glauca</i>	52	1	
<i>Brachycome aculeata</i>	52	1	
<i>Danthonia nudiflora</i>	52	+	
<i>Prunella vulgaris</i>	48	+	
<i>Asperula gunnii</i>	48	1	
<i>Agropyron scabrum</i>	48	+	
<i>Helichrysum scorpioides</i>	48	1	

## SNOW GUM WOODLANDS GLC COMMUNITY 2 : SUB-COMMUNITY 2

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 8 (1.1% of total)
<i>Acaena anserinifolia</i>	88	1	DISTRIBUTION : Scattered along the Great Dividing Range from the Snowy Range to the Bowen Mountains.
<i>Ranunculus graniticola</i>	88	+	
<i>Stellaria pungens</i>	88	+	
<i>Poa australis</i> spp. agg.	88	2	ENVIRONMENT : Well drained slopes grading to moister flats or depressions.
<i>Luzula campestris</i> spp. agg.	75	1	
<i>Geranium potentilloides</i>	75	1	
<i>Leucopogon suaveolens</i>	75	1	ALTITUDE : Mean = 1337m, Highest = 1600m, Lowest = 980m.
<i>Oreomyrrhis eriopoda</i>	75	1	
<i>Asperula scoparia</i>	63	+	
<i>Olearia erubescens</i>	63	1	STRUCTURE : Low woodland
<i>Celmisia longifolia</i>	63	1	
<i>Eucalyptus pauciflora</i>	63	2	
			MEAN FLORISTIC RICHNESS : 33 species per site
			MEAN WEED COMPOSITION : 4% of species, 3% of cover
NOTES : A species poor version of sub-community 2.1 with some affinities for sub-community 1.2 (e.g. the presence of wetland species such as <i>Leptospermum grandifolium</i> , <i>Carex appressa</i> and <i>Eucalyptus stellulata</i> in some of the sites of this sub-community.			

## MONTANE FORES COMMUNITY 3 : SUB-COMMUNITY 1

CHARACTER SPECIES	% FREQ. C/A	NO. OF SITES : 3 (0.4% of total)
<i>Acaena anserinifolia</i>	100 +	DISTRIBUTION : Confined to the north-east of the study area in the Nunniong Plateau area.
<i>Acrotriche serrulata</i>	100 1	
<i>Craspedia glauca</i>	100 +	ENVIRONMENT : Well drained slopes of northerly to northwesterly aspect.
<i>Eucalyptus dives</i>	100 1	
<i>Eucalyptus rubida</i>	100 1	ALTITUDE : Mean = 1156m, Highest = 1270m, Lowest = 1000m.
<i>Gonocarpus tetragynus</i>	100 +	
<i>Helichrysum scorpioides</i>	100 +	STRUCTURE : Low woodland
<i>Hibbertia obtusifolia</i>	100 +	
<i>Luzula campestris</i> spp. agg.	100 1	MEAN FLORISTIC RICHNESS : 33 species per site
<i>Olearia erubescens</i>	100 +	
<i>Platylobium formosum</i>	100 1	MEAN WEED COMPOSITION : 3% of species, 2% of cover
<i>Pultenaea juniperina</i>	100 3	
<i>Ranunculus graniticola</i>	100 1	NOTES : A very species poor version of sub-community 3.2
<i>Poa australis</i> spp. agg.	100 2	
<i>Epacris impressa</i>	67 +	
<i>Lomandra longifolia</i>	67 1	
<i>Danthonia</i> spp.	67 1	
<i>Deyeuxia</i> spp.	67 1	
<i>Epilobium</i> spp.	67 1	
<i>Asperula scoparia</i>	67 1	
<i>Brachycome decipiens</i>	67 1	
<i>Carex breviculmis</i>	67 +	
<i>Cassinia aculeata</i>	67 1	
<i>Daviesia latifolia</i>	67 1	
<i>Dianella revoluta</i>	67 +	
<i>Eucalyptus pauciflora</i>	67 1	
<i>Eucalyptus radiata</i>	67 1	
<i>Exocarpus strictus</i>	67 1	
<i>Geranium potentilloides</i>	67 +	
<i>Hydrocotyle hirta</i>	67 +	
<i>Hypericum gramineum</i>	67 +	
* <i>Hypochoeris radicata</i>	67 1	
<i>Fersoonia chamaepeuce</i>	67 1	

## MONTANE FOREST GLC COMMUNITY 3 : SUB-COMMUNITY 2

CHARACTER SPECIES	% FREQ. C/A	NO. OF SITES : 80 (11% of total)
<i>Poa australis</i> spp. agg.	94 2	DISTRIBUTION : Frequent on sheltered slopes forming the catchments of the Macalister and Wonnangatta Rivers and up to the Great Dividing Range from Mt. Hotham to the Nunniong Plateau.
<i>Acacia dealbata</i>	86 1	
<i>Dianella tasmanica</i>	82 1	
<i>Eucalyptus rubida</i>	81 1	
<i>Gonocarpus tetragynus</i>	81 1	
<i>Acaena anserinifolia</i>	77 1	
<i>Coprosma hirtella</i>	77 1	
<i>Stellaria pungens</i>	76 1	
<i>Styliidium graminifolium</i>	76 1	
<i>Lomandra longifolia</i>	71 1	
<i>Viola hederacea</i>	68 1	
<i>Polyscias sambucifolius</i>	63 1	
<i>Pteridium esculentum</i>	60 1	
<i>Polystichum proliferum</i>	59 1	ENVIRONMENT : Moist and sheltered subalpine slopes.
<i>Hydrocotyle hirta</i>	58 1	ALTITUDE : Mean = 1187m, Highest = 1440m, Lowest = 860m.
<i>Cassinia aculeata</i>	56 1	STRUCTURE : Open to Tall open-forest
<i>Eucalyptus dives</i>	56 1	MEAN FLORISTIC RICHNESS : 37 species per site
<i>Lagenifera stipitata</i>	55 +	MEAN WEED COMPOSITION : 2% of species, 1% of cover
<i>Daviesia ulicifolia</i>	54 1	NOTES : The structural variation in the sub-community is related to the presence or absence of the four major species of <i>Eucalyptus</i> ; <i>E. pauciflora</i> , <i>E. rubida</i> , <i>E. dives</i> and <i>E. delegatensis</i> . Where <i>E. delegatensis</i> occurs in significant quantities the forest is of considerable value for timber production and is usually of the structural type Tall open-forest. Where the other species dominate the structural type is open-forest. Despite this structural variation there is a strong floristic uniformity throughout sub-community 3.2
<i>Geranium potentilloides</i>	54 +	
<i>Eucalyptus pauciflora</i>	54 2	
<i>Leucopogon suaveolens</i>	53 1	
<i>Luzula campestris</i> spp. agg.	53 +	
<i>Asperula scoparia</i>	53 1	
<i>Acacia obliquinervia</i>	51 1	
<i>Cotula fillicula</i>	51 +	
<i>Olearia erubescens</i>	51 1	
<i>Clematis aristata</i>	50 +	
<i>Platylobium formosum</i>	49 1	
<i>Helichrysum scorpioides</i>	47 1	
<i>Senecio quadridentatus</i>	42 +	
<i>Olearia phlogopappa</i>	38 1	
<i>Oreomyrrhis eriopoda</i>	38 1	
<i>Arthropodium milleflorum</i>	38 +	
<i>Eucalyptus delegatensis</i>	37 2	
* <i>Hypochoeris radicata</i>	36 +	
<i>Olearia myrsinoides</i>	36 1	

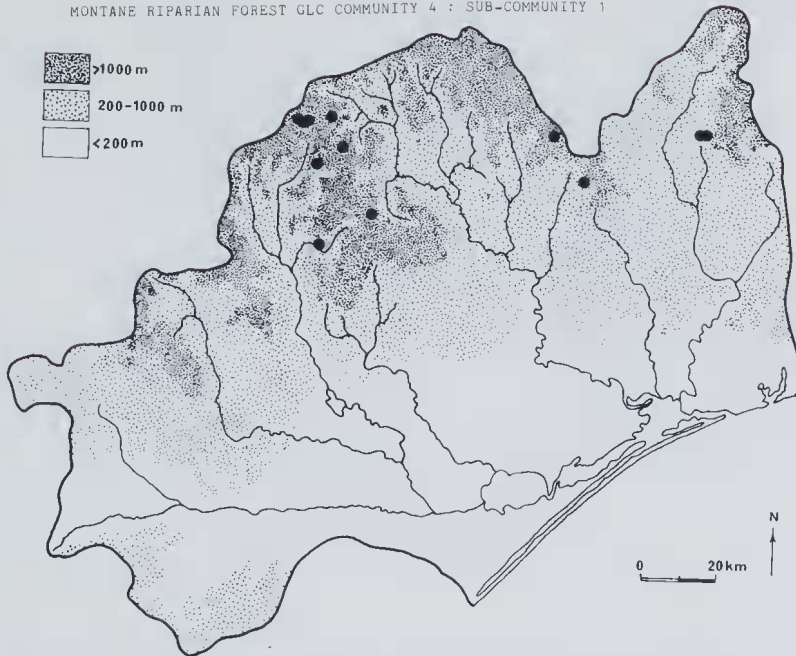

## MONTANE FOREST GLC COMMUNITY 3 : SUB-COMMUNITY 3

CHARACTER SPECIES	% FREQ. C/A	NO. OF SITES : 34 (4.7% of total)
<i>Poa australis</i> spp. agg.	97 1	DISTRIBUTION : Moderately widespread on the upper, well-watered slopes of the Snowy Range, north of Mt. Tamboritha, eastward to the Mt. Wellington region and scattered between the Aberfeldy and Mt. Baw Baw regions.
<i>Dianella tasmanica</i>	91 1	
<i>Acaena anserinifolia</i>	82 1	
<i>Polyscias sambucifolius</i>	79 1	ENVIRONMENT : Moist and sheltered subalpine slopes.
<i>Loprosma hirtella</i>	79 1	
<i>Stellaria pungens</i>	76 1	ALTITUDE : Mean = 1249m, Highest = 1580m, Lowest = 800m.
<i>Helichrysum scorpioides</i>	74 1	
<i>Cotula filicula</i>	74 1	
<i>Polystichum proliferum</i>	74 1	STRUCTURE : Open to Tall open-forest
<i>Stylidium graminifolium</i>	74 1	
<i>Olearia phlogopappa</i>	74 1	MEAN FLORISTIC RICHNESS : 42 species per site
<i>Oreomyrrhis eriopoda</i>	71 1	
<i>Gonocarpus tetragynus</i>	68 +	
<i>Viola hederacea</i>	68 1	MEAN WEED COMPOSITION : 4% of species, 3% of cover
<i>Acacia obliquinervia</i>	65 1	
<i>Lagenifera stipitata</i>	62 1	NOTES : This sub-community is floristically very similar to sub-community 3.2. Its distribution in the higher rainfall areas to the west of the study area and its proximity to gullies means that some wetland species (e.g. <i>Leptospermum grandifolium</i> and <i>Carex appressa</i> ) are common and species characteristic of drier country (e.g. <i>E. dives</i> and <i>Platylobium formosum</i> ) are absent. Sub-community 3.3 is more often dominated by <i>E. delegatensis</i> than is sub-community 3.2
<i>Luzula campestris</i> spp. agg.	62 +	
<i>Eucalyptus delegatensis</i>	59 2	
<i>Veronica derwentia</i>	59 1	
<i>Hypochoeris radicata</i>	59 +	
<i>Cassinia aculeata</i>	59 1	
<i>Arthropodium milleflorum</i>	56 +	
<i>Ranunculus plebeius</i>	56 +	
<i>Hydrocotyle hirta</i>	56 1	
<i>Acacia dealbata</i>	56 1	
<i>Olearia erubescens</i>	53 1	
<i>Olearia megalophylla</i>	53 1	
<i>Geranium potentilloides</i>	53 1	
<i>Erachyome aculeata</i>	50 1	
<i>Eucalyptus rubida</i>	50 1	
<i>Daviesia ulicifolia</i>	47 1	
<i>Senecio linearifolius</i>	47 1	
<i>Leucopogon gelidus</i>	47 1	

## MONTANE RIPARIAN FOREST GLC COMMUNITY 4 : SUB-COMMUNITY 1

CHARACTER SPECIES	% FREQ. C/A	NO. OF SITES : 12 (1.6% of total)
<i>Polystichum proliferum</i>	100	2
<i>Acaena anserinifolia</i>	91	1
<i>Poa australis</i> spp. agg.	91	1
<i>Blechnum fluviatile</i>	82	1
<i>Eucalyptus delegatensis</i>	82	1
<i>Australina muelleri</i>	82	1
<i>Geranium potentilloides</i>	82	1
<i>Carex appressa</i>	73	1
<i>Leptospermum grandifolium</i>	73	2
<i>Rubus parvifolius</i>	73	1
<i>Acacia dealbata</i>	73	1
<i>Cassinia aculeata</i>	73	1
<i>Dicksonia antarctica</i>	73	2
<i>Senecio linearifolius</i>	73	1
<i>Polyscias sambucifolius</i>	73	+
<i>Urtica incisa</i>	73	1
<i>Cotula fillicula</i>	64	+
<i>Hydrocotyle hirta</i>	64	1
<i>Stellaria lalacida</i>	64	1
<i>Tasmania lanceolata</i>	64	1
<i>Gnaphalium japonicum</i>	64	+
<i>Gleeria phlogopappa</i>	64	1
<i>Hypochoeris radicata</i>	55	+
<i>Lagenifera stipitata</i>	55	+
<i>Coprosma hirtella</i>	55	1
<i>Daviesia latifolia</i>	55	1
<i>Hypolepis rugosula</i>	55	+

**DISTRIBUTION** : Most common around the Snowy Range but is also scattered near Mts. Birregun and Nugong.

**ENVIRONMENT** : Deep gullies and watercourses contained within tall, sheltered, montane to subalpine forests.

**ALTITUDE** : Mean = 1121m, Highest = 1500m, Lowest = 820m.

**STRUCTURE** : Tall open-forest

**MEAN FLORISTIC RICHNESS** : 42 species per site

**MEAN WEED COMPOSITION** : 5% of species, 3% of cover

**NOTES** : This sub-community includes the subalpine parallel of the well-known fern gully of lower wet sclerophyll forests. Many species are common to both these vegetation types but species such as *Leptospermum grandifolium* and *Eucalyptus delegatensis* identify sub-community 4.1 as one restricted to higher altitudes.

## MONTANE RIPARIAN FOREST GLC COMMUNITY 4 : SUB-COMMUNITY 2

CHARACTER SPECIES	% FREO. C/A	NO. OF SITES : 29 (4.0% of total)
<i>Rubus parvifolius</i>	93 1	DISTRIBUTION : Localized within an area including creeksides and headwaters of the Wonnongatta, Wongungarra, Macalister and Humffray Rivers.
<i>Pteridium esculentum</i>	90 1	
<i>Acacia dealbata</i>	90 1	ENVIRONMENT : High altitude creeksides, often containing large granite boulders but invariably with a buildup of alluvial soils.
<i>Geranium potentilloides</i>	90 1	
<i>Coprosma quadrifida</i>	86 1	ALTITUDE : Mean = 746m, Highest = 1500m, Lowest = 300m.
<i>Eucalyptus radiata</i>	86 1	
<i>Acacia melanoxylon</i>	86 1	STRUCTURE : Open to Tall open-forest
<i>Viola hederacea</i>	86 1	
<i>Acaena anserinifolia</i>	83 1	MEAN FLORISTIC RICHNESS : 52 species per site
<i>Clematis aristata</i>	83 1	
<i>Carex appressa</i>	83 1	MEAN WEED COMPOSITION : 7% of species, 6% of cover
<i>Cassinia aculeata</i>	76 1	
<i>Asperula scoparia</i>	76 1	NOTES : Structurally, this sub-community is quite typical of both highland and lowland riparian communities. It is characterised by a tall canopy and a dense shrub layer, overlying a ground layer containing a variety of ferns and sedges. Many species of this sub-community are common to riverside sites throughout the State (e.g. <i>Eucalyptus viminalis</i> , <i>E. radiata</i> , <i>Acacia melanoxylon</i> , <i>Rubus parvifolius</i> , <i>Pomaderris aspera</i> ) but certain species identify this community as being montane (e.g. <i>Leptospermum grandifolium</i> ).
<i>Poa australis</i> spp. agg.	76 1	
<i>Stellaria pungens</i>	76 +	
<i>Gnaphalium japonicum</i>	72 +	
<i>Blechnum nudum</i>	72 1	
<i>Hydrocotyle hirta</i>	72 1	
<i>Pomaderris aspera</i>	69 1	
<i>Polystichum proliferum</i>	69 1	
<i>Prunella vulgaris</i>	66 1	
<i>Eucalyptus viminalis</i>	66 1	
<i>Cotula filicula</i>	62 +	
* <i>Hypochoeris radicata</i>	59 1	
<i>Lagenifera stipitata</i>	59 1	
<i>Polyscias sambucifolius</i>	59 1	
<i>Dichondra repens</i>	52 1	
<i>Epilobium cinereum</i>	52 +	
<i>Leptospermum grandifolium</i>	52 1	
<i>Dianella tasmanica</i>	48 1	
<i>Echinopogon ovatus</i>	48 1	
<i>Stellaria flaccida</i>	48 +	

## WET SCLEROPHYLL FOREST GLC COMMUNITY 5 : SUB-COMMUNITY 1

CHARACTER SPECIES	% FREQ. C/A	NO. OF SITES : 73 (10.1% of total)
<i>Polystichum proliferum</i>	85	1
<i>Clematis aristata</i>	83	1
<i>Acacia dealbata</i>	82	1
<i>Hydrocotyle hirta</i>	81	1
<i>Pteridium esculentum</i>	79	1
<i>Viola hederacea</i>	78	1
<i>Acaena anserinifolia</i>	76	1
<i>Dicksonia antarctica</i>	75	1
<i>Cassinia aculeata</i>	75	1
<i>Geranium potentilloides</i>	71	1
<i>Senecio linearifolius</i>	71	1
<i>Coprosma quadrifida</i>	69	1
<i>Alsophila australis</i>	65	1
<i>Tetrarrhena juncea</i>	64	1
<i>Olearia phlogopappa</i>	61	1
<i>Pomaderris aspera</i>	61	1
<i>Eucalyptus regnans</i>	58	2
<i>Prostanthera lasianthos</i>	58	1
<i>Histiopteris incisa</i>	57	+
<i>Australina muelleri</i>	54	1
<i>Olearia lirata</i>	54	1
<i>Olearia argophylla</i>	53	1
<i>Stellaria flaccida</i>	53	1
<i>Polyscias sambucifolius</i>	50	1
* <i>Hypochoeris radicata</i>	49	+
<i>Acacia melanoxylon</i>	46	1
<i>Sambucus gaudichaudiana</i>	44	1
* <i>Rubus fruticosus</i> spp. agg.	44	1
<i>Oxalis corniculata</i>	42	+
<i>Bedfordia arborescens</i>	42	1
<i>Blechnum nudum</i>	40	1
<i>Urtica incisa</i>	38	1
<i>Dianella tasmanica</i>	36	+
<i>Blechnum wattsi</i>	36	1

**DISTRIBUTION** : A widespread community occurring as far east as the upper Tambo River catchment (Mt. Baldhead/Ensay region), less commonly near the Wongungarra and Macalister Rivers but frequent in the Central Gippsland highlands, Noojee/Mt. Baw Baw area and the Strzelecki Ranges to the South.

**ENVIRONMENT** : Well watered montane sites to about 1200m altitude.

**ALTITUDE** : Mean = 645m, Highest = 1300m, Lowest = 130m.

**STRUCTURE** : Tall open-forest

**MEAN FLORISTIC RICHNESS** : 37 species per site

**MEAN WEED COMPOSITION** : 7% of species, 5% of cover

**NOTES** : This selection of sites contains virtually all of the Mountain Ash forests encountered in this study. This species (*Eucalyptus regnans*) is the tallest hardwood tree in the world and is keenly sought for its timber. The "shrub layer", including *Acacia* spp., of such tall forests frequently attains heights of 30m, and may be virtually unstratified to about 10m. Low light conditions below this level, along with deep leaf litter, usually mean a low species richness for the ground layer.

## DAMP SCLEROPHYLL FOREST GLC COMMUNITY 6 : SUB-COMMUNITY 1

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 15 (2.0% of total)
<i>Tetrarrhena juncea</i>	100	2	DISTRIBUTION : Occurring in the south-west of the study area around Neerim South, Tanjil South and Boolarra.
<i>Gonocarpus tetragynus</i>	93	1	
<i>Leptospermum juniperinum</i>	93	1	ENVIRONMENT : Dry slopes and gullies
<i>Pultenaea gunnii</i>	87	1	
<i>Acacia mucronata</i>	87	1	ALTITUDE : Mean = 250m, Highest = 400m, Lowest = 160m.
<i>Eucalyptus obliqua</i>	87	1	
<i>Gahnia radula</i>	80	2	STRUCTURE : Open forest or Woodland
<i>Epacris impressa</i>	80	1	
<i>Pteridium esculentum</i>	80	1	MEAN FLORISTIC RICHNESS : 40 species per site
<i>Viola hederacea</i>	80	1	
<i>Lomandra filiformis</i>	73	1	MEAN WEED COMPOSITION : 3% of species, 1% of cover
* <i>Hypochoeris radicata</i>	73	+	
<i>Amperea xiphoclada</i>	67	1	NOTES : This sub-community occurs commonly on the lower, more exposed sides of hills which also support sub-community 6.2 and 6.3. It is the lowest altitude sub-community of Community 6. The understorey supports species usually regarded as characteristic of dry areas or heathlands (e.g. <i>Amperea xiphoclada</i> , <i>Epacris impressa</i> , <i>Xanthorrhoea minor</i> ) as well as those characteristic of fire regeneration (e.g. <i>Goodenia</i> sp., <i>Cassinia</i> spp. and <i>Leptospermum</i> sp.). This is the only vegetation of the study area in which <i>E. consideriana</i> is a character species.
<i>Cassinia aculeata</i>	67	+	
<i>Eucalyptus radiata</i>	67	1	
<i>Lomandra longifolia</i>	67	+	
<i>Poa australis</i> spp. aeg.	67	1	
<i>Goodenia ovata</i>	60	1	
<i>Burchardia umbellata</i>	60	1	
<i>Drosera auriculata</i>	60	1	
<i>Olearia lirata</i>	60	+	
<i>Xanthorrhoea minor</i>	60	1	
<i>Eucalyptus consideriana</i>	53	2	

## DAMP SCLEROPHYLL FOREST GLC COMMUNITY 6 : SUB-COMMUNITY 2

CHARACTER SPECIES	% FREQ. C/A	NO. OF SITES : 53 (7.3% of total)
<i>Pteridium esculentum</i>	94	DISTRIBUTION : Occurring over most of the intermediate altitude range of the study area from Noojee to Ensay.
<i>Viola hederacea</i>	91	
<i>Acacia dealbata</i>	85	ENVIRONMENT : Wet, foothill slopes usually sheltered from direct northerly exposure.
<i>Clematis aristata</i>	81	
<i>Eucalyptus cypellocarpa</i>	74	ALTITUDE : Mean = 436m, Highest = 900m, Lowest = 100m.
<i>Geranium potentilloides</i>	74	
<i>Poa australis</i> spp. agg.	74	STRUCTURE : Open to Tall open-forest
<i>Dianella tasmanica</i>	70	
<i>Gonocarpus teucrioides</i>	62	MEAN FLORISTIC RICHNESS : 42 species per site
<i>Eucalyptus obliqua</i>	62	
<i>Cassinia aculeata</i>	62	MEAN WEED COMPOSITION : 3% of species, 2% of cover
<i>Lagenifera stipitata</i>	60	
<i>Lomandra longifolia</i>	58	NOTES : The frequency of <i>Pteridium esculentum</i> indicates significant disturbance (particularly fire induced) to this common vegetation type of the foothills. <i>E. cypellocarpa</i> and <i>E. obliqua</i> , which dominate the upper stratum, and the understorey of sclerophyllous shrubs, herbs and grasses are all widespread. This sub-community represents a transition between wet and dry sclerophyll vegetation types.
<i>Cassinia longifolia</i>	57	
* <i>Hypochoeris radicata</i>	57	A riparian, wetter variant of this sub-community contains <i>Prostanthera lasianthos</i> and <i>E. viminalis</i> .
<i>Oxalis corniculata</i>	57	
<i>Coprosma quadrifida</i>	57	
<i>Tetrarrhena juncea</i>	55	
<i>Pomaderris aspera</i>	55	
<i>Goodenia ovata</i>	51	
<i>Acaena anserinifolia</i>	51	
<i>Billardiera scandens</i>	47	
<i>Epacris impressa</i>	47	
<i>Alsophila australis</i>	47	
<i>Hydrocotyle hirta</i>	47	
<i>Microlaena stipoides</i>	43	
<i>Senecio quadridentatus</i>	42	
<i>Olearia lirata</i>	42	
<i>Culcita dubia</i>	40	
<i>Gonocarpus tetragynus</i>	40	
<i>Gnaphalium japonicum</i>	38	
<i>Senecio linearifolius</i>	38	
<i>Pimelea axiflora</i>	38	
<i>Blechnum cartilagineum</i>	36	
<i>Eucalyptus radiata</i>	36	
<i>Calium gauoichaudii</i>	36	

## DAMP SCLEROPHYLL FOREST GLC COMMUNITY 6 : SUB-COMMUNITY 3

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 13 (1.8% of total)
<i>Cassinia aculeata</i>	100	1	DISTRIBUTION : Common forests of the Noojee, Tanjil Bren and Loch Valley areas with a single record to the south in the Strzlecki Ranges.  ENVIRONMENT : Contained within gullies of montane, open-forests but not necessarily adjacent to permanent waterways.  ALTITUDE : Mean = 300m, Highest = 500m, Lowest = 180m.  STRUCTURE : Open-forest  MEAN FLORISTIC RICHNESS : 51 species per site  MEAN WEED COMPOSITION : 6% of species, 3% of cover  NOTES : A floristically rich sub-community, the canopy consisting of several species (e.g. <i>E. cupello-</i> <i>carpa</i> , <i>E. obliqua</i> , <i>E. radiata</i> , <i>Acacia dealbata</i> ) and the lower strata containing a diverse assortment of damp forest species (e.g. <i>Platylobium formosum</i> , <i>Tetratheca ciliata</i> , <i>Acacia mucronata</i> , <i>A. verticillata</i> , <i>Pimelia axiflora</i> ). Disturbance within sub-community 6.3 if low. This is reflected in the fairly high species richness, particularly when compared with sub-community 6.4 (a disturbed, lower diversity subset of this sub-community).
<i>Coprosma quadrifida</i>	100	1	
<i>Eucalyptus cypellocarpa</i>	100	1	
<i>Eucalyptus obliqua</i>	100	1	
<i>Gonocarpus teucrioides</i>	100	1	
<i>Ulearia lirata</i>	100	1	
<i>Pteridium esculentum</i>	100	1	
<i>Viola hederacea</i>	100	1	
<i>Acacia mucronata</i>	92	1	
<i>Clematis aristata</i>	92	1	
<i>Tetrarrhena juncea</i>	92	2	
<i>Alsophila australis</i>	85	1	
* <i>Hypochoeris radiata</i>	85	+	
<i>Eucalyptus radiata</i>	85	1	
<i>Coodenia ovata</i>	85	1	
<i>Ceranium potentilloides</i>	77	1	
<i>Pomaderris aspera</i>	77	1	
<i>Pultenaea juniperina</i>	77	1	
<i>Acacia verticillata</i>	77	1	
<i>Blechnum cartilagineum</i>	77	1	
<i>Culcita dubia</i>	77	1	
<i>Acacia dealbata</i>	69	1	
<i>Hydrocotyle hirta</i>	69	+	
<i>Lepidosperma elatius</i>	69	1	
<i>Pimelia axiflora</i>	69	1	
* <i>Rubus fruticosus</i> spp. agg.	69	+	
<i>Oxalis corniculata</i>	62	+	
<i>Polyscias sambucifolius</i>	62	1	
<i>Platylobium formosum</i>	62	2	
<i>Blechnum nudum</i>	62	1	
<i>Prunella vulgaris</i>	54	+	
<i>Rubus parvifolius</i>	54	1	
<i>Cnaphalium japonicum</i>	54	+	
<i>Senecio quadridentatus</i>	54	+	
<i>Tetratheca ciliata</i>	54	1	

## DAMP SCLEROPHYLL FOREST GLC COMMUNITY 6 : SUB-COMMUNITY 4

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 12 (1.7% of total)
<i>Pteridium esculentum</i>	100	1	DISTRIBUTION : Scattered distribution between the Noojee and Aberfeldy areas.
<i>Tetrarrhena juncea</i>	100	2	
<i>Eucalyptus obliqua</i>	92	1	ENVIRONMENT : Well-watered slopes of upland areas in and around the Baw Baw ranges. The sites, however, are not those which retain moisture for long periods. Soils are frequently gravelly clays.
<i>Viola nederacea</i>	92	+	
<i>Eucalyptus cypellocarpa</i>	83	1	ALTITUDE : Mean = 547m, Highest = 950m, Lowest = 200m.
<i>Acacia mucronata</i>	75	2	
<i>Eucalyptus sieberi</i>	75	2	STRUCTURE : Open-forest
<i>Goodenia ovata</i>	75	1	
<i>Platylobium formosum</i>	75	3	MEAN FLORISTIC RICHNESS : 30 species per site
<i>Eucalyptus radiata</i>	67	1	
<i>Gonocarpus teurcioides</i>	67	1	MEAN WEED COMPOSITION : 0% of species, 0% of cover
<i>Cassinia aculeata</i>	67	1	
<i>Tetratheca ciliata</i>	58	1	NOTES : A mixed species forest which is a lower diversity version of sub-community 6.3. Each of the most common eucalypts are of commercial value and are or have been harvested for building timber (the range of this sub-community is contained within a long-active milling and forest management area). A result of this activity is the high proportion and abundance of species which although native, are indicative of disturbances within the forest (particularly fuel reduction burning). Species such as <i>Pteridium esculentum</i> , <i>Tetrarrhena juncea</i> , <i>Acacia mucronata</i> , <i>Platylobium formosum</i> , <i>Pultenaea juniperina</i> and <i>Eucalyptus sieberi</i> are becoming increasingly common due to present forest management practices. Another consequence of these activities is the very low floristic richness and almost complete absence of introduced species.
<i>Pomaderris aspera</i>	58	1	
<i>Bedfordia arborescens</i>	58	+	
<i>Pultenaea juniperina</i>	58	1	

## JAMP SCLEROPHYLL FOREST CLC COMMUNITY 6 : SUB-COMMUNITY 5

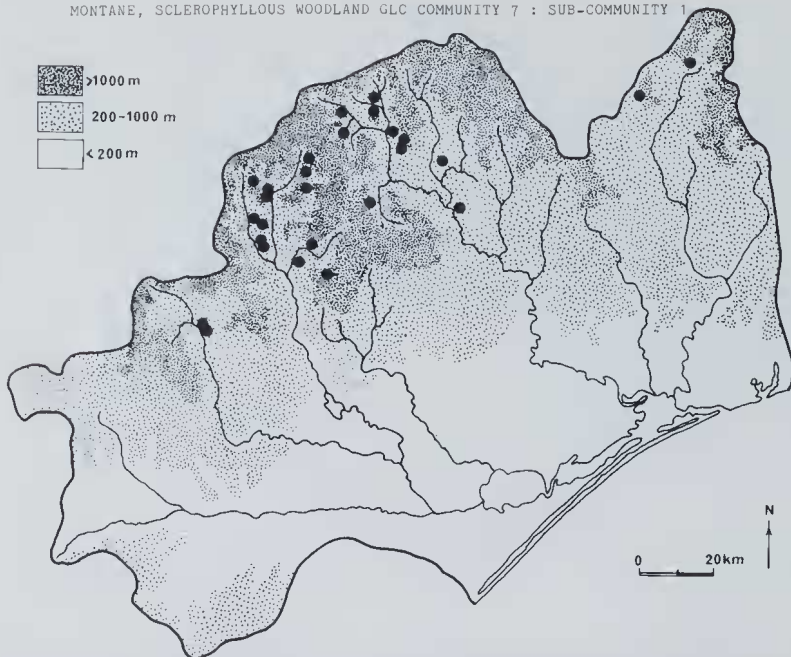

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 10 (1.4% of total)
<i>Daviesia ulicifolia</i>	100	1	DISTRIBUTION : Slopes of the Great Dividing Range in the region of Aberfeldy and Matlock with an isolated occurrence on the Bower Range near Ensay.  ENVIRONMENT : High-altitude, well-drained hillside.  ALTITUDE : Mean = 875m, Highest = 1120m, Lowest = 650m.  STRUCTURE : Open-forest  MEAN FLORISTIC RICHNESS : 45 species per site  MEAN WEED COMPOSITION : 3% of species, 2% of cover  NOTES : This sub-community retains a number of species common to the sub-communities 6.3 and 6.4 (e.g. <i>Eucalyptus cypellocarpa</i> , <i>Polyscias sambucifolia</i> , <i>Polystichum proliferum</i> ) but includes several other species which indicate the well-drained nature of the soils within the region (e.g. <i>E. dives</i> , <i>Lomandra longifolia</i> , <i>Daviesia ulicifolia</i> ).  The absence of significant quantities of merchantable timber within sub-community 6.5 virtually precludes the incidence of disturbance to the forest as a result of timber harvesting. However, fire appears to have had a modifying influence in promoting certain (native) species to proportions above those expected in an undisturbed forest. (e.g. <i>Pteridium esculentum</i> , <i>Acacia mucronata</i> , <i>Tetrarrhena juncea</i> ).
<i>Dianella tasmanica</i>	100	1	
<i>Pteridium esculentum</i>	100	1	
<i>Acacia dealbata</i>	90	1	
<i>Cassinia aculeata</i>	90	1	
<i>Eucalyptus radiata</i>	90	1	
<i>Gonocarpus tetragynus</i>	90	1	
<i>Poa australis</i> spp. agg.	90	2	
<i>Senecio quadridentatus</i>	90	+	
<i>Stylidium graminifolium</i>	80	1	
<i>Viola hederacea</i>	80	1	
<i>Lomandra longifolia</i>	80	1	
<i>Luzula campestris</i> spp. agg.	80	+	
<i>Gnaphalium japonicum</i>	70	+	
<i>Eucalyptus cypellocarpa</i>	70	1	
<i>Ceranium potentilloides</i>	70	+	
<i>Stellaria pungens</i>	70	1	
<i>Hydrocotyle hirta</i>	60	1	
<i>Acacia mucronata</i>	60	2	
<i>Coprosma hirtella</i>	60	1	
<i>Eucalyptus dives</i>	60	1	
* <i>Hypochoeris radicata</i>	60	+	
<i>Tetrarrhena juncea</i>	60	1	
<i>Acaena anserinifolia</i>	60	1	
<i>Deyeuxia rodwayi</i>	60	1	
<i>Polystichum proliferum</i>	60	1	
<i>Senecio linearifolius</i>	60	1	
<i>Polyscias sambucifolius</i>	60	1	

## DAMP SCLEROPHYLL FOREST GLC COMMUNITY 6 : SUB-COMMUNITY 6

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 15 (2.0% of total)
<i>Poa australis</i> spp. agg.	83	1	DISTRIBUTION : Scattered around Mt. Wellington, Mt. Thomson and Mt. Steve near the upper reaches of the Dargo and Wentworth Rivers, and also east on Mt. Sugarloaf, Mt. Little Dick and south east of Mt. Nugong near Ensay.  ENVIRONMENT : Intermediate altitudes on sheltered slopes, but not extending to gullies.  ALTITUDE : Mean = 664m, Highest = 980m, Lowest = 280m.  STRUCTURE : Open to Tall open-forest  MEAN FLORISTIC RICHNESS : 38 species per site  MEAN WEED COMPOSITION : 3% of species, 2% of cover  NOTES : A rather poorly defined sub-community existing as a congregation of several species which although mainly native are indicative of fire disturbance.
<i>Pteridium esculentum</i>	83	1	
<i>Eucalyptus cypellocarpa</i>	78	1	
<i>Lomandra longifolia</i>	78	1	
<i>Gonocarpus tetragynus</i>	78	1	
<i>Hydrocotyle hirta</i>	72	+	
<i>Poranthera microphylla</i>	72	+	
<i>Galium gaudichaudii</i>	72	+	
<i>Hibbertia obtusifolia</i>	72	1	
<i>Viola hederacea</i>	72	1	
* <i>Hypochoeris radicata</i>	67	+	
<i>Senecio quadridentatus</i>	67	+	
<i>Eucalyptus globosa</i>	67	1	
<i>Geranium potentilloides</i>	61	+	
<i>Acacia dealbata</i>	61	1	
<i>Olearia lirata</i>	61	1	
<i>Acaena anserinifolia</i>	56	1	
<i>Cassinia longifolia</i>	56	1	
<i>Clematis aristata</i>	56	+	
<i>Eucalyptus obliqua</i>	56	1	

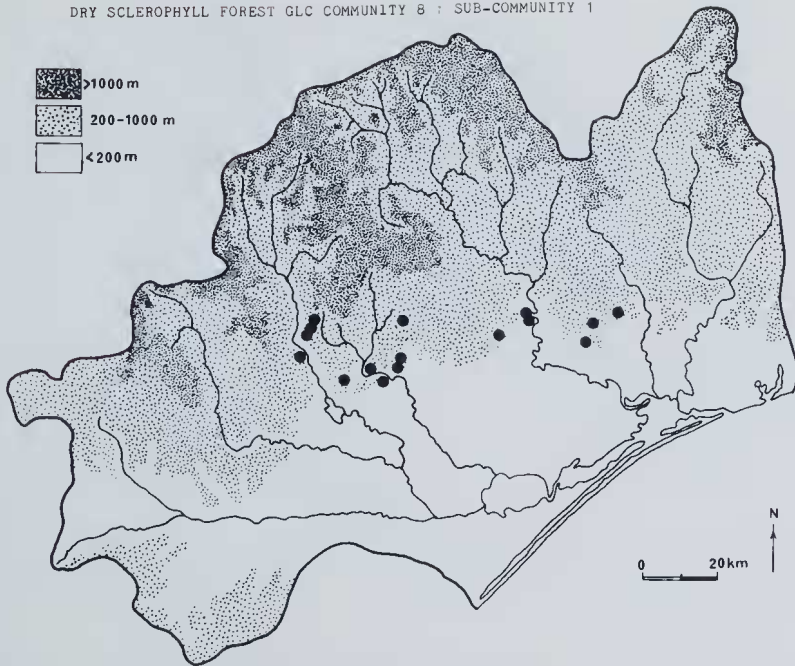

## MONTANE, SCLEROPHYLLOUS WOODLAND GLC COMMUNITY 7 : SUB-COMMUNITY 1

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 28 (3.9% of total)
<i>Poa australis</i> spp. agg.	100	1	DISTRIBUTION : Never distant from the backbone of the Great Dividing Range and concentrated within the watersheds of the Macalister and Wonnangatta Rivers, with a few isolated occurrences near Mt. Lookout, Aberfeldy and the Bowen Range.
<i>Lomandra longifolia</i>	93	1	
<i>Eucalyptus dives</i>	93	1	ENVIRONMENT : Dry, rather exposed upland slopes, typically with a northerly aspect and frequently steep. Water retention in the poorly structured, often shaly soils is low.
<i>Dianella revoluta</i>	86	1	
<i>Hibbertia obtusifolia</i>	86	1	ALTITUDE : Mean = 761m, Highest = 1200m, Lowest = 420m.
<i>Platylobium formosum</i>	82	1	
<i>Gonocarpus tetragynus</i>	82	1	STRUCTURE : Woodland
<i>Eucalyptus mannifera</i>	79	1	
<i>Exocarpus strictus</i>	75	+	MEAN FLORISTIC RICHNESS : 37 species per site
<i>Persoonia confertiflora</i>	75	+	
<i>Tetratheca ciliata</i>	71	1	MEAN WEED COMPOSITION : 2% of species, 1% of cover
<i>Pimelia linifolia</i>	68	1	
<i>Acacia dealbata</i>	64	+	NOTES : A high proportion of dry slope species (e.g. <i>Eucalyptus dives</i> , <i>E. macrorhyncha</i> , <i>E. mannifera</i> , <i>Persoonia confertiflora</i> , <i>Hardenbergia violacea</i> etc.) appear in this community and similarly few plants of the wetter montane forests intrude. This sub-community has attracted little disturbance through either fire control measures or logging due to its open, sparse nature and lack of sawlog species.
<i>Monotoca scoparia</i>	61	1	
<i>Stylidium graminifolium</i>	61	1	
<i>Hardenbergia violacea</i>	57	1	
<i>Cassinia aculeata</i>	54	1	
<i>Acrotriche serrulata</i>	50	1	
<i>Viola hederacea</i>	50	+	
<i>Pteridium esculentum</i>	50	1	
<i>Daviesia virgata</i>	50	1	
<i>Dillwynia retorta</i>	46	1	

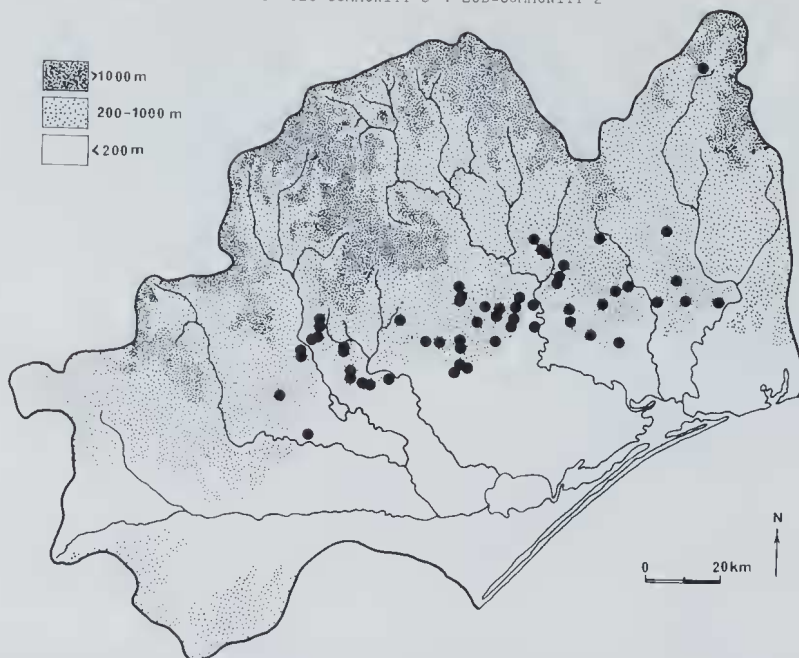

## DRY SCLEROPHYLL FOREST GLC COMMUNITY 8 : SUB-COMMUNITY 1

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 17 (2.3% of total)
<i>Hydrocotyle hirta</i>	94	1	DISTRIBUTION : Mostly on slopes in the upper reaches of the Avon, Macalister, Mitchell and Nicholson River catchments.
<i>Poa australis</i> spp. agg.	94	1	
<i>Dichondra repens</i>	82	1	ENVIRONMENT : Dry hills, often of northerly and north-easterly aspect.
<i>Eucalyptus polyanthemus</i>	82	1	
<i>Oxalis corniculata</i>	82	+	ALTITUDE : Mean = 257m, Highest = 500m, Lowest = 70m.
<i>Cassinia longifolia</i>	76	2	
<i>Geranium potentilloides</i>	76	1	STRUCTURE : Open-forest to Woodland
<i>Glycine clandestina</i>	76	1	
<i>Hypericum gramineum</i>	76	+	MEAN FLORISTIC RICHNESS : 52 species per site
* <i>Hypochoeris radicata</i>	76	1	
<i>Lagenifera stipitata</i>	71	1	MEAN WEED COMPOSITION : 6% of species, 5% of cover
<i>Microlaena stipoides</i>	71	1	
<i>Acacia mearnsii</i>	65	1	NOTES : The abundance of species such as <i>Cassinia longifolia</i> , <i>Hypericum gramineum</i> , <i>Hypochoeris radicata</i> , <i>Senecio quadridentatus</i> and <i>Luzula campestris</i> strongly suggest a history of fire and grazing for this type of vegetation. Nevertheless a large percentage of this floristically-rich vegetation maintains most of its original flora.
<i>Chellanthes tenuifolia</i>	65	1	
<i>Hibbertia obtusifolia</i>	65	1	
<i>Senecio quadridentatus</i>	65	1	
<i>Galium gaudichaudii</i>	65	+	
<i>Luzula campestris</i> spp. agg.	65	+	
<i>Gnaphalium japonicum</i>	59	+	
<i>Billardiera scandens</i>	59	+	
<i>Cymbonotus preissianus</i>	59	1	
<i>Lepidosperma laterale</i>	59	+	
<i>Stypandra glauca</i>	59	1	
<i>Veronica plebeia</i>	53	+	
<i>Leptospermum phyllicoides</i>	53	2	
<i>Lomandra longifolia</i>	53	1	
<i>Phyllanthus hirtellus</i>	53	+	

## DRY SCLEROPHYLL FORES: GLC COMMUNITY 8 : SUB-COMMUNITY 2

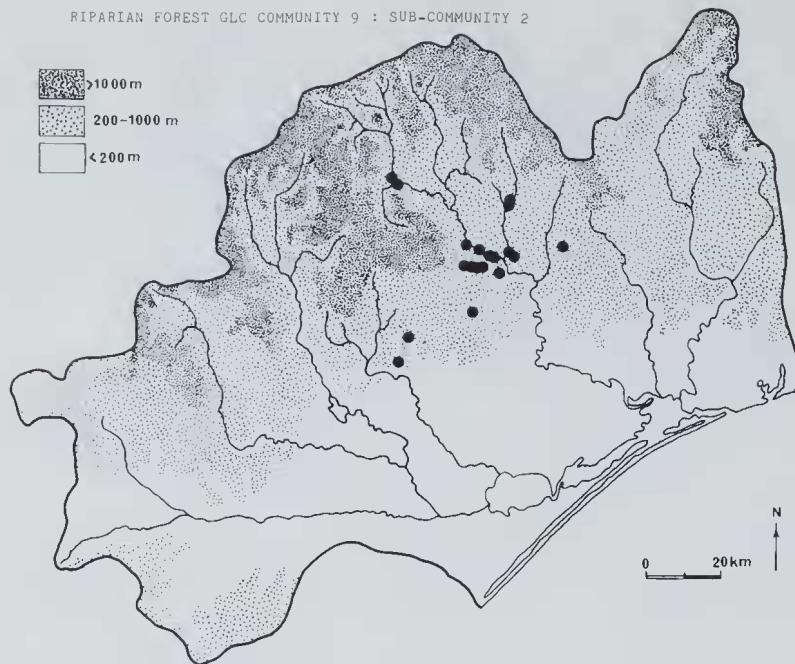

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 59 (8% of total)
<i>Cassinia longifolia</i>	86	1	DISTRIBUTION : Throughout the central and eastern foothills of the study area.
<i>Lomandra longifolia</i>	83	1	
<i>Poa australis</i> spp. agg.	80	1	ENVIRONMENT : Dry hills, often of northerly and north-easterly aspect.
<i>Hibbertia obtusifolia</i>	68	1	
<i>Stypantra glauca</i>	64	1	ALTITUDE : Mean = 352m, Highest = 660m, Lowest = 80m.
<i>Eucalyptus polyanthemos</i>	61	1	
<i>Lagenifera stipitata</i>	59	1	STRUCTURE : Open-forest to Woodland
* <i>Hypochoeris radicata</i>	59	1	
<i>Hypericum gramineum</i>	54	+	MEAN FLORISTIC RICHNESS : 35 species per site
<i>Hydrocotyle hirta</i>	54	1	
<i>Dianella revoluta</i>	53	1	MEAN WEED COMPOSITION : 2% of species, 2% of cover
<i>Acacia dealbata</i>	51	1	
<i>Eucalyptus macrorhyncha</i>	51	1	NOTES : Sub-communities 8.1 and 8.2 are floristically very similar however the understorey of the latter is characterized by a lower abundance of herbs, (e.g. <i>Dichondra repens</i> , <i>Oxalis corniculata</i> , <i>Geranium potentilloides</i> are absent) and a higher abundance of small sclerophyllous shrubs (e.g. <i>Epacris impressa</i> , <i>Phyllanthus hirtellus</i> , <i>Hardenbergia violacea</i> ).
<i>Lepidosperma laterale</i>	47	1	
<i>Acacia falciformis</i>	46	1	There is also a suggestion of disturbance effects reflected in the low floristic richness of this sub-community when compared to sub-community 8.1.
<i>Gonocarpus tetragynus</i>	44	1	
<i>Hardenbergia violacea</i>	44	+	
<i>Acacia terminalis</i>	44	1	
<i>Eucalyptus sieberi</i>	42	1	
<i>Phyllanthus hirtellus</i>	41	1	
<i>Viola hederacea</i>	41	1	
<i>Microlaena stipoides</i>	41	1	
<i>Epacris impressa</i>	39	1	
<i>Eucalyptus globoides</i>	39	1	
<i>Galium gaudichaudii</i>	39	+	
<i>Senecio quadridentatus</i>	37	+	
<i>Persoonia confertiflora</i>	37	+	
<i>Eucalyptus cypellocarpa</i>	37	1	
<i>Cassinia aculeata</i>	36	+	

## RIPARIAN FOREST GLC COMMUNITY 9 : SUB-COMMUNITY 1

CHARACTER SPECIES	% FREQ. C/A	NO. OF SITES : 6 (8% of total)
<i>Hymenanthera dentata</i>	100 1	DISTRIBUTION : Occurring on the Dargo, Wentworth and Crooked Rivers in the north of the study area.
* <i>Rubus fruticosus</i> spp. agg.	100 1	
<i>Eucalyptus melliodora</i>	83 1	ENVIRONMENT : Riparian vegetation of the higher part of this altitude range.
<i>Acacia dealbata</i>	83 1	
<i>Acaena anserinifolia</i>	83 1	ALTITUDE : Mean = 343m, Highest = 540m, Lowest = 220m.
<i>Dichondra repens</i>	83 1	
<i>Oxalis corniculata</i>	83 1	STRUCTURE : Open-forest
* <i>Rosa rubiginosa</i>	83 1	
<i>Prunella vulgaris</i>	67 1	MEAN FLORISTIC RICHNESS : 44 species per site
<i>Eucalyptus bridgesiana</i>	67 1	
<i>Acacia mearnsii</i>	67 1	MEAN WEED COMPOSITION : 22% of species, 22% of cover.
<i>Acacia melanoxylon</i>	67 1	
* <i>Anagallis arvensis</i>	67 +	NOTES : This riparian vegetation occurs amongst otherwise dry hillsides of the Dargo region. Agriculture and mining have led to a high degree of disturbance with a number of introduced species such as <i>Rubus fruticosus</i> and <i>Rosa rubiginosa</i> being significant.
* <i>Cirsium vulgare</i>	67 1	
<i>Eucalyptus viminalis</i>	67 1	
<i>Geranium potentilloides</i>	67 1	
* <i>Hypochoeris radicata</i>	67 1	
<i>Leptospermum phyllicoides</i>	67 2	
<i>Pteridium esculentum</i>	67 2	

## RIPARIAN FOREST GLC COMMUNITY 9 : SUB-COMMUNITY 2

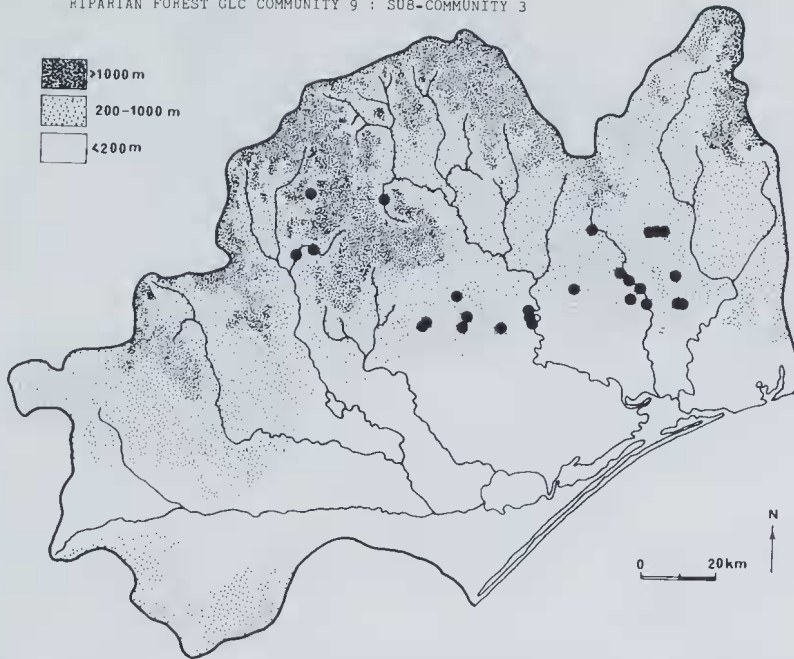

CHARACTER SPECIES	% FREQ.	C/A	CHARACTER SPECIES	% FREQ.	C/A

<i>Hydrocotyle hirta</i>	55	1			
<i>Rubus parvifolius</i>	55	+			
* <i>Aira caryophyllaea</i>	50	+			
<i>Dichelachne crinita</i>	50	+			
<i>Ceranium retrorsum</i>	50	1			

NO. OF SITES : 20 (2.6% of total)
DISTRIBUTION : Widespread in the central part of the study area centering on Dargo.
ENVIRONMENT : Riparian vegetation surrounded by dry hillsides.
ALTITUDE : Mean = 335m, Highest = 600m, Lowest = 180m.
STRUCTURE : Open-forest
MEAN FLORISTIC RICHNESS : 75 species per site
MEAN WEED COMPOSITION : 21% of species, 20% of cover.
NOTES : This sub-community represents a seriously disturbed riparian vegetation, characterised by a large number of native and introduced weedy species. Most of these are herbs and reflect agricultural practice in the district. Many of the farms in the area are now derelict and most of sub-community 9.2 is on land of this type.
Sub-community 9.2 is floristically the richest vegetation of the study area. Although a significant proportion of its constituent species are introduced it still has the highest mean number of native species per site (60) of all vegetation types.

## RIPARIAN FOREST GLC COMMUNITY 9 : SUB-COMMUNITY 3

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 29 (4% of total)
<i>Pomaderris aspera</i>	93	1	DISTRIBUTION : Widespread east of Glenaladale, also in the Mt. Tamboritha area.
<i>Dichondra repens</i>	93	1	
<i>Poa australis</i> spp. agg.	86	1	ENVIRONMENT : Riparian vegetation
<i>Geranium potentilloides</i>	86	1	
<i>Pteridium esculentum</i>	79	1	ALTITUDE : Mean = 283m, Highest = 680m, Lowest = 100m.
<i>Adiantum aethiopicum</i>	79	1	
* <i>Hypochoeris radicata</i>	79	1	STRUCTURE : Open-forest
<i>Viola hederacea</i>	75	1	
<i>Acaena anserinifolia</i>	75	1	MEAN FLORISTIC RICHNESS : 51 species per site
<i>Hydrocotyle hirta</i>	75	1	
<i>Oxalis corniculata</i>	75	+	MEAN WEED COMPOSITION : 7% of species, 5% of cover
<i>Acacia dealbata</i>	71	1	
<i>Lomandra longifolia</i>	71	1	NOTES : Sub-communities 9.2 and 9.3 share a large number of species most of which are native. The major difference between these sub-communities is the large complement of introduced species in 9.2. Sub-community 9.2 therefore represents a disturbed (possibly re-established) form of 9.3 which has lost none of its native species. There are a number of other potential sites for this vegetation which are utilized for agriculture and possess only remnants of the original flora.
<i>Clematis aristata</i>	68	+	
<i>Cassinia aculeata</i>	68	1	
<i>Leptospermum phyllicoides</i>	68	2	
<i>Cassinia longifolia</i>	64	1	
<i>Coprosma quadrifida</i>	64	1	
<i>Eucalyptus bridgesiana</i>	64	1	
* <i>Rubus fruticosus</i> spp. agg.	61	+	
<i>Acacia melanoxylon</i>	61	1	
<i>Gnaphalium japonicum</i>	61	+	
<i>Eucalyptus viminalis</i>	61	1	
<i>Galium gaudichaudii</i>	57	+	
<i>Stellaria flaccida</i>	57	1	
<i>Blechnum nudum</i>	54	1	
<i>Frostanthera lasianthos</i>	54	1	
<i>Frustraria vulgaris</i>	54	1	
<i>Lagenifera stipitata</i>	54	1	
<i>Stellaria pungens</i>	54	1	
* <i>Centaurium pulchellum</i>	50	+	
<i>Lepidosperma laterale</i>	50	1	
<i>Carex appressa</i>	46	1	
<i>Luzula campestris</i> spp. agg.	46	+	
<i>Pimelea axiflora</i>	46	+	

## RIPARIAN FOREST GLC COMMUNITY 9 : SUB-COMMUNITY 4

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 2 (0.27% of total)
Acacia floribunda	100	1	DISTRIBUTION : Both examples of this community were sampled on the banks of the Tambo River near Bruthen.
*Cerastium glomeratum	100	1	
*Cirsium vulgare	100	+	ENVIRONMENT : Close proximity to an intensive agricultural region and a large waterway.
*Conyza bonariensis	100	1	
*Dactylis glomerata	100	1	ALTITUDE : Mean = 90m, Highest = 160m, Lowest = 20m.
*Galium aparine	100	+	
Geranium potentilloides	100	1	STRUCTURE : Low shrubland
*Hypochoeris radicata	100	1	
Leptospermum phyllicoides	100	1	MEAN FLORISTIC RICHNESS : 42 species per site
Phragmites australis	100	1	
*Plantago lanceolata	100	1	MEAN WEED COMPOSITION : 39% of species, 36% of cover.
Poa australis spp. agg.	100	2	
Pteridium esculentum	100	1	NOTES : The sites on which this sub-community is found are highly disturbed by agriculture. It is probable that they once supported sub-community 9.3 vegetation.
Rubus parvifolius	100	1	
*Acetosella vulgaris	100	1	
Rumex crispus	100	1	
Veronica plebeia	100	+	
*Vicia angustifolia	100	+	
*Rubus fruticosus spp. agg.	100	1	

## LEPTOSPERMUM MYRSINOIDES HEATHLAND GLC COMMUNITY 10 : SUB-COMMUNITY 1

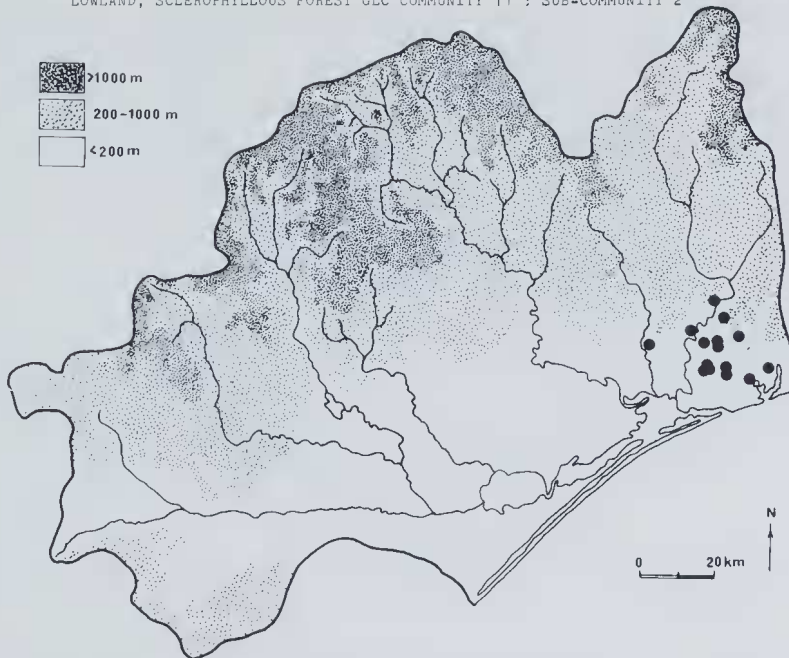

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 25 (3.5% of total)
<i>Epacris impressa</i>	100	1	DISTRIBUTION : Mainly south and west from Sperm Whale Head on podzols developed from siliceous sands.
<i>Bossiaea cinerea</i>	92	1	
<i>Banksia marginata</i>	92	1	ENVIRONMENT : Flat or undulating areas beyond the influence of sea winds, on deep siliceous sands.
<i>Lomandra longifolia</i>	92	1	
<i>Monotoca scoparia</i>	92	1	ALTITUDE : Mean = 23m, Highest = 160m, Lowest = 0m.
<i>Leptospermum myrsinoides</i>	88	2	
<i>Leucopogon ericoides</i>	88	1	STRUCTURE : Low open-woodland to Closed heath.
<i>Acacia oxycedrus</i>	88	1	
<i>Leucopogon virgatus</i>	88	1	MEAN FLORISTIC RICHNESS : 38 species per site
<i>Banksia serrata</i>	83	1	
<i>Pteridium esculentum</i>	79	1	MEAN WEED COMPOSITION : 4% of species, 2% of cover
<i>Cautis pentandra</i>	75	1	
<i>Eucalyptus nitida</i>	75	1	NOTES : This is a representative of a distinctive floristic community dominated by the small-leaved, sclerophyllous shrub <i>Leptospermum myrsinoides</i> . Most of the species in sub-community 10.1 are common in heathland vegetation throughout the State.
<i>Leptospermum juniperinum</i>	71	1	
<i>Hibbertia fasciculata</i>	67	1	
<i>Hibbertia virgata</i>	63	1	
<i>Amperea xiphocladia</i>	58	+	
* <i>Hypochoeris radicata</i>	58	+	
<i>Lepidosperma concavum</i>	54	1	
<i>Brachyloma daphnoides</i>	50	1	
<i>Dampiera stricta</i>	50	1	
<i>Dillwynia glaberrima</i>	50	1	
<i>Drosera peltata</i>	50	+	
<i>Lomandra filiformis</i>	50	1	

## LOWLAND, SCLEROPHYLLOUS FOREST GLC COMMUNITY 11 : SUB-COMMUNITY 1

CHARACTER SPECIES	% FREQ.	C/A	
<i>Viola hederacea</i>	100	1	NO. OF SITES : 18 (2.5% of total)
<i>Billardiera scandens</i>	90	+	
<i>Lagenifera stipitata</i>	90	1	DISTRIBUTION : Confined in the study area to the foothills within the Bruthen, Nowa Nowa and Lake Tyers region.
<i>Microlaena stipoides</i>	90	1	
<i>Pteridium esculentum</i>	90	2	ENVIRONMENT : Dry conditions on the undulating land system which includes the tributaries of Lake Tyers. Soils are often deep sands but occasionally also include clays and gravelly soils.
<i>Cassinia longifolia</i>	80	1	
<i>Clematis aristata</i>	80	1	
<i>Eucalyptus globoidea</i>	80	2	
<i>Hibbertia obtusifolia</i>	70	+	ALTITUDE : Mean = 78m, Highest = 140m, Lowest = 20m.
<i>Poa australis</i> spp. agg.	70	1	
<i>Acianthus exsertus</i>	70	+	STRUCTURE : Open-forest
<i>Eucalyptus cypellocarpa</i>	70	1	
<i>Galium gaudichaudii</i>	70	+	MEAN FLORISTIC RICHNESS : 46 species per site
<i>Hydrocotyle hirta</i>	70	1	
<i>Luzula campestris</i> spp. agg.	70	+	MEAN WEED COMPOSITION : 3% of species, 2% of cover
<i>Olearia lirata</i>	70	1	
<i>Goodenia ovata</i>	60	1	NOTES : This restricted vegetation is intermediate in composition between the more coastal heaths and the open-forests of the foothills. Throughout most of its range sub-community 11.1 shows strong signs of disturbance by fire. Most understorey plants are small and young and <i>Pteridium esculentum</i> is the dominant understorey species in most sites.
<i>Hibbertia aspera</i>	60	1	
* <i>Hypochoeris radicata</i>	60	1	
<i>Lomandra longifolia</i>	60	1	
<i>Opercularia hispida</i>	60	+	
<i>Senecio quadridentatus</i>	60	+	
<i>Veronica plebeia</i>	60	1	

## LOWLAND, SCLEROPHYLLOUS FOREST GLC COMMUNITY 11 : SUB-COMMUNITY 2

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 10 (1.4% of total)
<i>Epacris impressa</i>	94	1	DISTRIBUTION : The range of this community is effectively the same as that of 11.1 but is generally in closer proximity to water, such as Lake Tyers and the Nicholson River.
<i>Gonocarpus teucroides</i>	94	1	
<i>Lomandra longifolia</i>	94	1	ENVIRONMENT : Dry conditions on the undulating land system which includes sub-community 11.1
<i>Pteridium esculentum</i>	94	2	
<i>Acrotriche serrulata</i>	89	1	ALTITUDE : Mean = 127m, Highest = 270m, Lowest = 50m
<i>Persoonia linearis</i>	89	+	
<i>Craspedia glauca</i>	89	1	STRUCTURE : Open-forest
<i>Tetratheca pilosa</i>	83	1	
<i>Eucalyptus globoidea</i>	83	2	MEAN FLORISTIC RICHNESS : 47 species per site
<i>Lagenifera stipitata</i>	83	1	
<i>Xanthorrhoea minor</i>	78	1	MEAN WEED COMPOSITION : 2% of species, 1% of cover
* <i>Hypochoeris radicata</i>	78	1	
<i>Eucalyptus sieberi</i>	78	1	NOTES : This sub-community is basically a more disturbed and species-poor version of sub-community 11.1. It contains few species not found in sub-community 11.1 and lacks <i>Eucalyptus sieberi</i> as well as a number of ground cover species.
<i>Hydrocotyle hirta</i>	78	1	
<i>Phyllanthus hirtellus</i>	72	1	
<i>Viola hederacea</i>	72	1	
<i>Lomatia ilicifolia</i>	72	+	
<i>Stypandra glauca</i>	67	1	
<i>Hibbertia obtusifolia</i>	67	1	
<i>Eucalyptus cypellocarpa</i>	61	1	
<i>Acacia genistifolia</i>	61	1	
<i>Senecio quadridentatus</i>	61	+	
<i>Billardiera scandens</i>	61	+	
<i>Poa australis</i> spp. agg.	61	1	
<i>Hypericum gramineum</i>	56	+	
<i>Microlaena stipoides</i>	56	1	

## COASTAL BANKSIA WOODLAND GLC COMMUNITY 12 : SUB-COMMUNITY 1

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 43 (6% of total)
<i>Scirpus nodosus</i>	88	1	DISTRIBUTION : Virtually all sites sampled were along the leeward side of the 90 Mile Beach dunes.
<i>Dichondra repens</i>	86	1	
* <i>Hypochoeris radicata</i>	86	1	ENVIRONMENT : Protected secondary dunes inland from community 13. Soils are virtually pure calcareous sand with a minimal topsoil development.
<i>Lomandra longifolia</i>	83	1	
<i>Pteridium esculentum</i>	76	2	ALTITUDE : Mean = 0m, Highest = 20m, Lowest = 0m.
<i>Hydrocotyle hirta</i>	69	1	
<i>Geranium potentilloides</i>	67	1	STRUCTURE : Low open-woodland
<i>Lagenifera stipitata</i>	64	1	
<i>Oxalis corniculata</i>	64	+	MEAN FLORISTIC RICHNESS : 44 species per site
* <i>Cerastium glomeratum</i>	64	+	
<i>Crassula sieberiana</i>	64	+	MEAN WEED COMPOSITION : 14% of species, 10% of cover.
<i>Banksia integrifolia</i>	62	1	
<i>Ranunculus sessiliflorus</i>	60	1	NOTES : This sub-community consists primarily of sclerophyllous plants growing on nutrient-poor calcareous sands. However, a small number of species which are found almost exclusively in the two or three metres immediately adjacent to the lake (e.g. <i>Samolus repens</i> , <i>Distichlis distichophylla</i> ) are usually representative of a true salt marsh community (see Bridgewater, 1975). This latter vegetation is poorly developed around the Gippsland Lakes and its components are therefore included in Community 12.
<i>Tetragonia implexicoma</i>	60	1	
<i>Melaleuca ericifolia</i>	55	2	The past history of grazing on vegetation appears to have affected its floristic composition. Many introduced species have invaded sub-community 12.1 and make up (on average) 14% of its flora.
<i>Microlaena stipitoides</i>	52	1	
<i>Cotula australis</i>	52	1	
<i>Poa australis</i> spp. agg.	52	1	
<i>Glycine clandestina</i>	50	+	
<i>Rhagodia baccata</i>	50	1	
<i>Lepidosperma concavum</i>	50	1	
<i>Luzula campestris</i> spp. agg.	50	+	
<i>Baumea juncea</i>	45	1	
<i>Gonocarpus teucrioides</i>	45	+	
* <i>Cirsium vulgare</i>	43	+	
<i>Senecio</i> spp.	43	1	
<i>Scirpus antarcticus</i>	43	+	
<i>Acacia longifolia</i>	40	1	
<i>Samolus repens</i>	40	1	
* <i>Conyza bonariensis</i>	40	+	
<i>Distichlis distichophylla</i>	40	1	
* <i>Sonchus oleraceus</i>	40	+	

## PRIMARY DUNE SCRUB GLC COMMUNITY 13 : SUB-COMMUNITY 1

CHARACTER SPECIES	% FREQ.	C/A	NO. OF SITES : 3 (0.42% of total)
* <i>Ammophila arenaria</i>	100	3	DISTRIBUTION : Distributed along the length of the 90 Mile Beach between Seaspray and Lakes Entrance.
<i>Apium prostratum</i>	100	+	
<i>Leucopogon parviflorus</i>	100	+	ENVIRONMENT : Frontal dunes frequently exposed to strong, salt-laden winds.
<i>Rhagodia baccata</i>	100	1	
<i>Scirpus nodosus</i>	100	1	ALTITUDE : Mean = 0m, Highest = 0m, Lowest = 0m.
<i>Calocephalus brownii</i>	57	1	
<i>Galium gaudichaudii</i>	57	+	STRUCTURE : Shrubland
<i>Spinifex hirsutus</i>	57	1	
<i>Tetragonia implexicoma</i>	57	1	MEAN FLORISTIC RICHNESS : 24 species per site
<i>Acacia longifolia</i>	57	1	
<i>Clematis microphylla</i>	57	1	MEAN WEED COMPOSITION : 17% of species, 21% of cover.
<i>Crassula sieberiana</i>	57	+	
<i>Dichondra repens</i>	57	1	NOTES : With the exception of the introduced Marram Grass ( <i>Ammophila arenaria</i> ), frequently planted as a sand-binder, this well-defined community is dominated by native species. The lack of disturbance to this community is probably a function of its inaccessibility (e.g. the almost entirely unroaded dune region of the 90 Mile Beach) which in turn demonstrates the fecundity and dispersal ability of <i>A. arenaria</i> . This grass and the native <i>Spinifex hirsutus</i> (the frequency of which seems to have decreased since the introduction of <i>A. arenaria</i> might be regarded among the most important species of the coastal areas. Their sand-binding ability stabilizes the dunes which afford protection from oceanic winds.
* <i>Hypochoeris radicata</i>	57	+	
<i>Leptospermum laevigatum</i>	57	2	
<i>Olearia axillaris</i>	57	1	
<i>Oxalis corniculata</i>	57	1	
<i>Pelargonium australe</i>	57	1	
<i>Actites megalocarpus</i>	57	1	
* <i>Sonchus oleraceus</i>	57	+
